

Let X_1, X_2, \dots, X_n be a random sample from any distribution with unknown parameter θ which takes values in a parameter space Θ .

We ultimately want to test

$$H_0 : \theta \in \Theta_0$$

$$H_1 : \theta \in \Theta \setminus \Theta_0$$

We also want
the “best”
possible test.

where Θ_0 is some subset of Θ .

The Power Function

$\gamma(\theta) = P(\text{Reject } H_0 \text{ when the parameter is } \theta)$

$$\gamma(\theta) = P(\text{Reject } H_0; \theta)$$

θ is an argument that can be anywhere in the parameter space Θ .

- it could be a θ from H_0
- it could be a θ from H_1

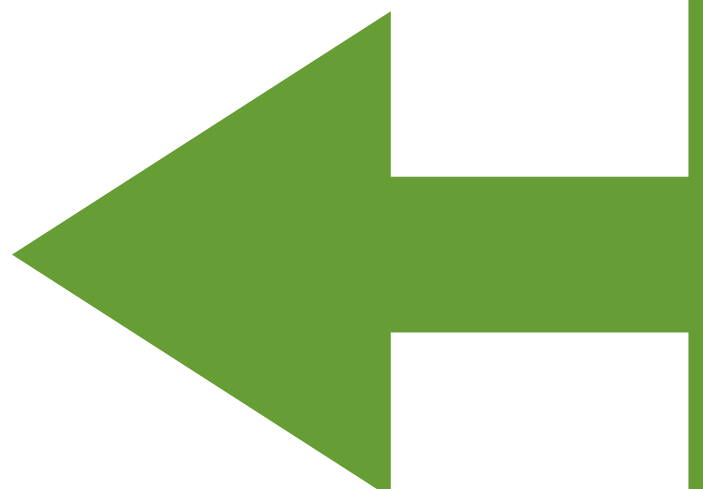

The Power Function

Note that

$$\alpha = \max P(\text{Reject } H_0 \text{ when true})$$

$$= \max_{\theta \in \Theta_0} P(\text{Reject } H_0; \theta)$$

$$= \max_{\theta \in \Theta_0} \gamma(\theta)$$

Other notation
is $\max_{\theta \in H_0}$

The Power Function

Note that

$$\beta = \max P(\text{Fail to Reject } H_0 \text{ when false})$$

$$= \max_{\theta \in \Theta \setminus \Theta_0} P(\text{Fail to Reject } H_0; \theta)$$

$$= \max_{\theta \in \Theta \setminus \Theta_0} [1 - P(\text{Reject } H_0; \theta)]$$

$$= \max_{\theta \in \Theta \setminus \Theta_0} [1 - \gamma(\theta)]$$

Other notation
is $\max_{\theta \in H_1}$

The Power Function

Power functions are useful for comparing two hypothesis tests.

Step One:

Choose an estimator for μ .

- What is an estimator?
- Really this should be “Choose a statistic that you can work with.”

Let X_1, X_2, \dots, X_n be a random sample from the normal distribution with mean μ and known variance σ^2 .

Consider the hypotheses

$$H_0 : \mu \geq \mu_0 \quad H_1 : \mu < \mu_0$$

where μ_0 is fixed and known.

Derive a test with level of significance (size) α .

Step One:

Choose an estimator for μ .

$$\hat{\mu} = \bar{X}$$

Step Four: Conclusion

Reject H_0 , in favor of H_1 , if

$$\bar{X} < \mu_0 + z_{1-\alpha} \frac{\sigma}{\sqrt{n}}$$

Find the power function of this test.

$$\gamma(\mu) = P(\text{Reject } H_0; \mu)$$

$$= P\left(\bar{X} < \mu_0 + z_{1-\alpha} \frac{\sigma}{\sqrt{n}}; \mu\right)$$

$$= P\left(\frac{\bar{X} - \mu}{\sigma/\sqrt{n}} < \frac{\mu_0 + z_{1-\alpha}\sigma/\sqrt{n} - \mu}{\sigma/\sqrt{n}}; \mu\right)$$

$$Z \sim N(0, 1)$$

Find the power function of this test.

$$\gamma(\mu) = P\left(Z < \frac{\mu_0 + z_{1-\alpha}\sigma/\sqrt{n} - \mu}{\sigma/\sqrt{n}}; \mu\right)$$

$$= \Phi\left(\frac{\mu_0 + z_{1-\alpha}\sigma/\sqrt{n} - \mu}{\sigma/\sqrt{n}}\right)$$

$$H_0 : \mu \geq \mu_0$$

$$H_1 : \mu < \mu_0$$

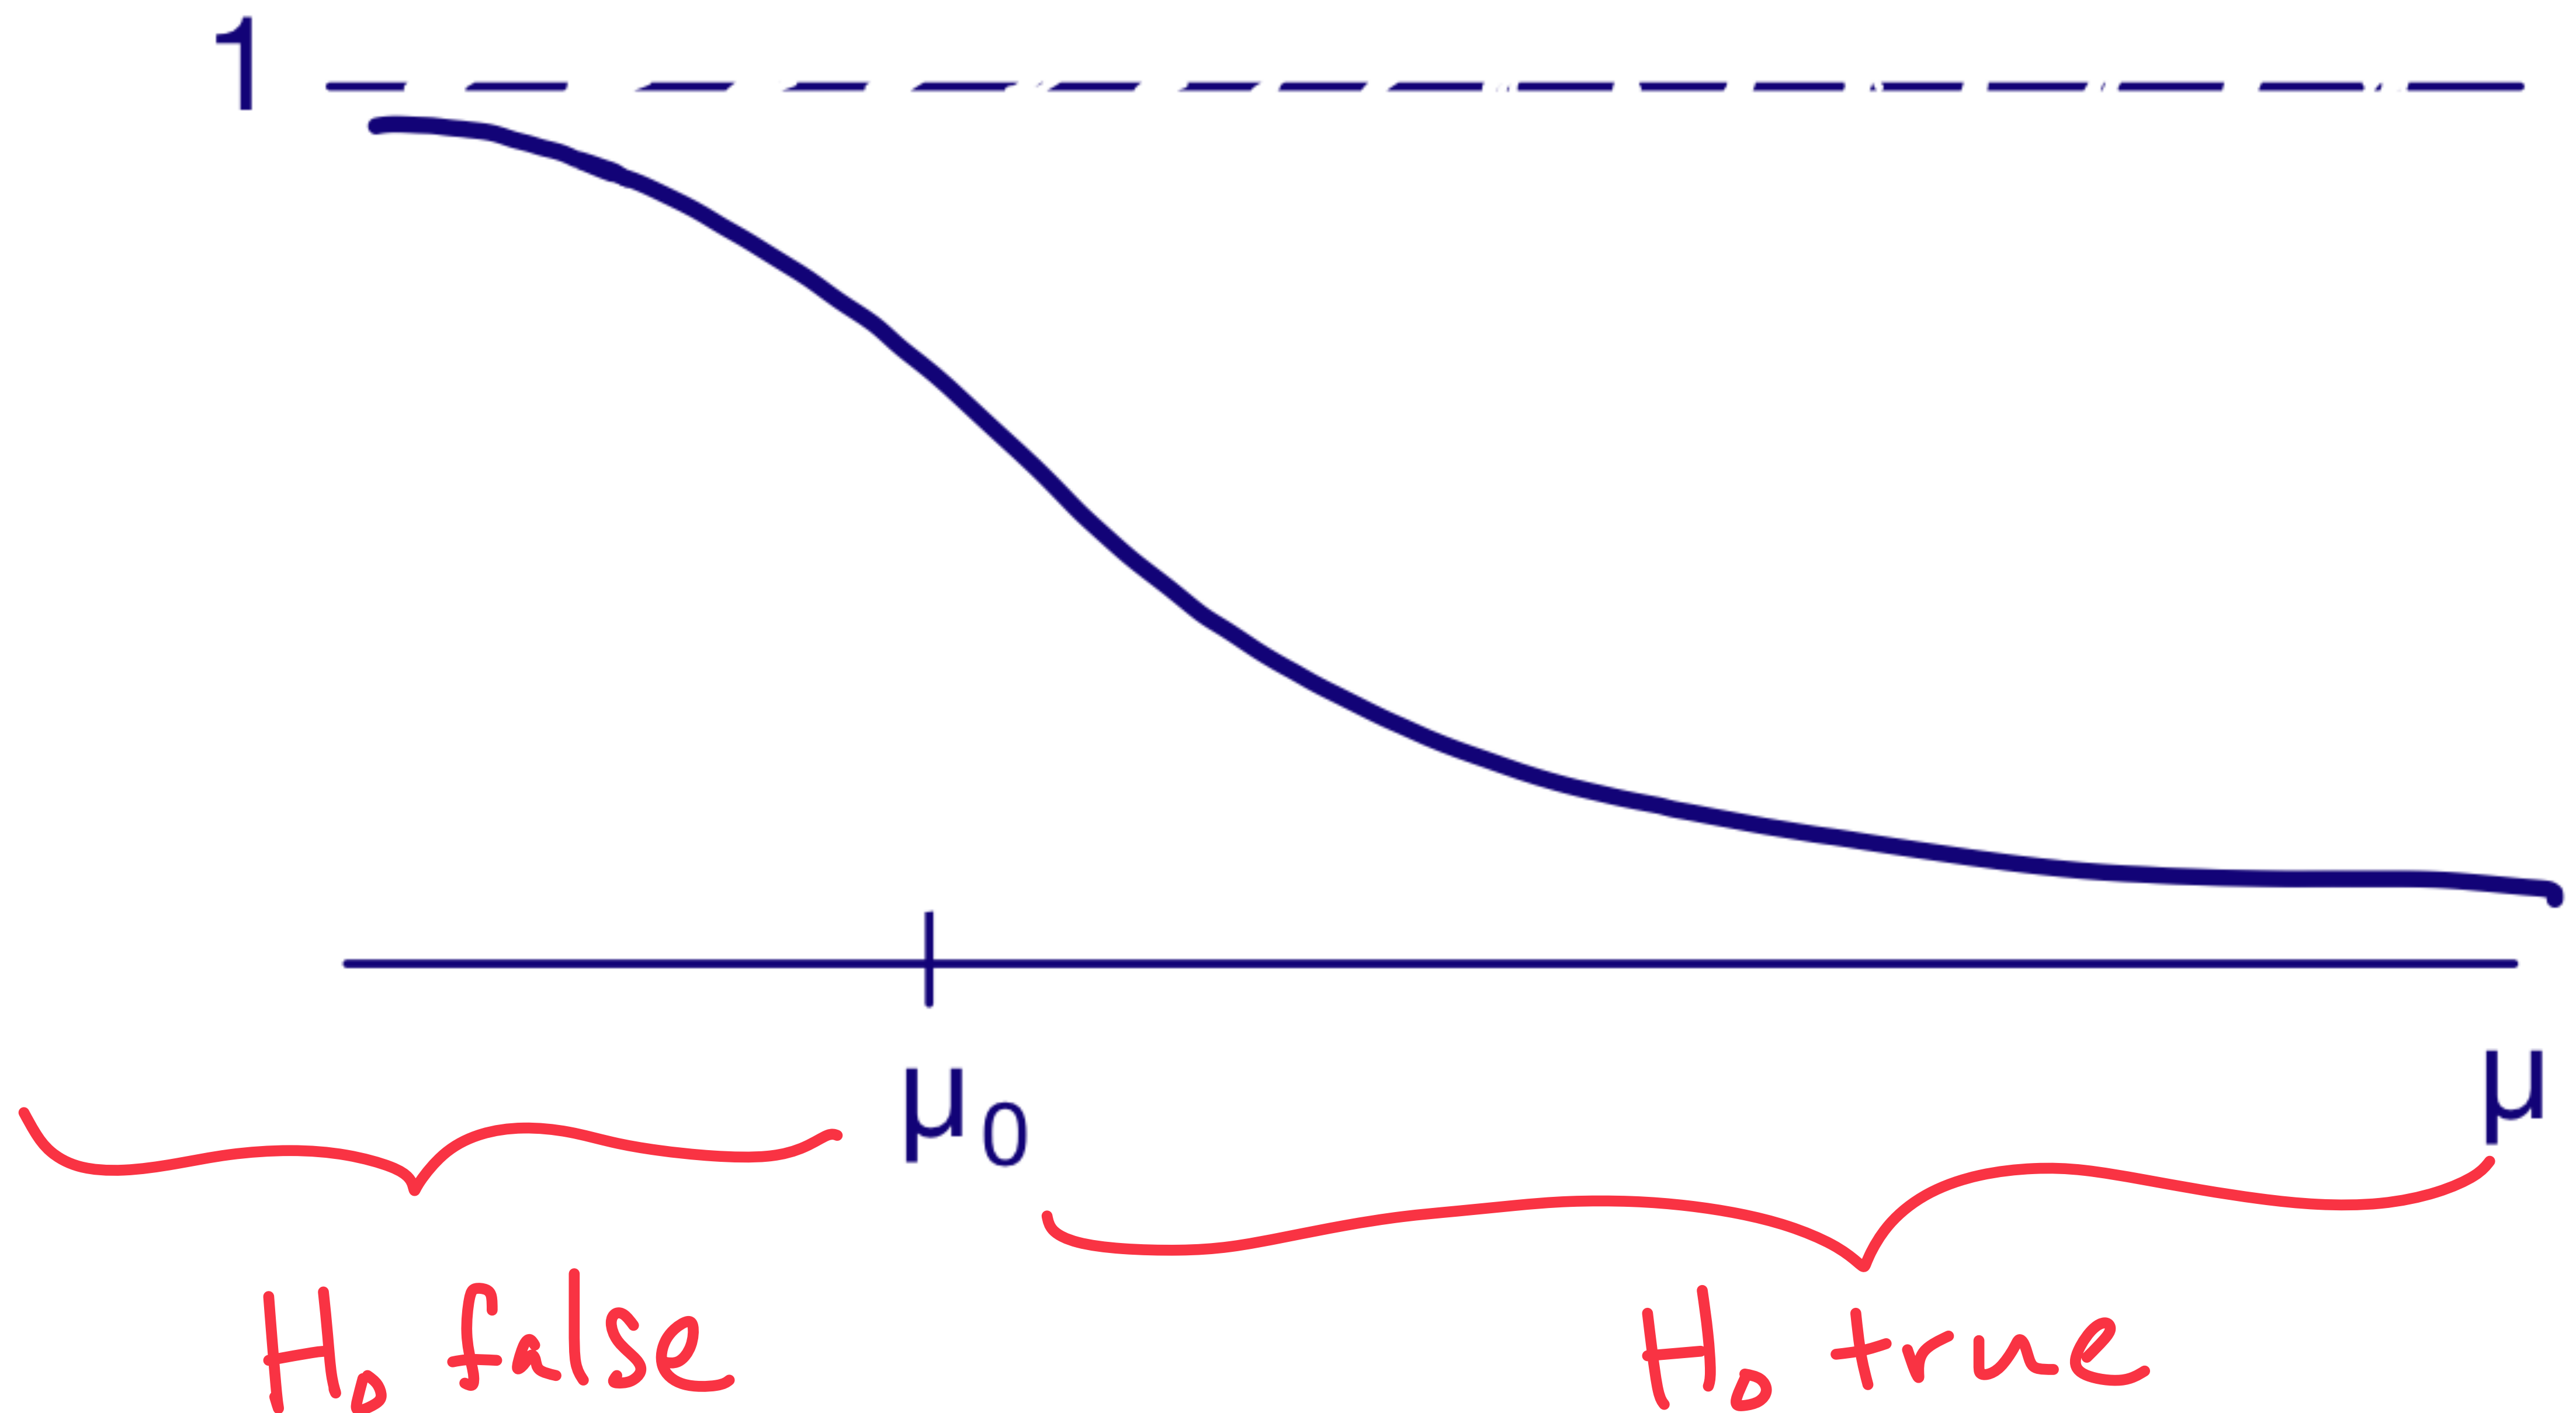

What does the power function for a “good” test of these hypotheses look like?

$$H_0 : \mu \geq \mu_0$$

$$H_1 : \mu < \mu_0$$

What does the power function for a “good” test of these hypotheses look like?

$$H_0 : \mu \geq \mu_0$$

$$H_1 : \mu < \mu_0$$

Where is α on this graph?

$$H_0 : \mu \geq \mu_0$$

$$H_1 : \mu < \mu_0$$

Where is α on this graph?

A Second Test of Size α

$$H_0 : \mu \geq \mu_0$$

$$H_1 : \mu < \mu_0$$

Step One:

Choose an “estimator” for μ .

$$\hat{\mu} = \max(X_1, X_2, \dots, X_n)$$

Step Two: Form of the Test

Reject H_0 , in favor of H_1 , if

$$\max(X_1, X_2, \dots, X_n) < c$$

for some c to be determined.

$$H_0 : \mu \geq \mu_0$$

$$H_1 : \mu < \mu_0$$
