Let $X_1, X_2, ..., X_n$ be a random sample from any distribution with mean μ and variance σ^2 .

$$\sigma^2 = Var[X] := E[(X - \mu)^2]$$

To estimate this from the sample, we could use ____

$$\tilde{S}^2 = \frac{\sum_{i=1}^n (X_i - \overline{X})^2}{n}$$

"sample variance"

- Currently, before numerical observations, this is a random variable.
- It has its own distribution, its own mean, and its own variance.

$$\sum_{i=1}^{n} (X_i - \overline{X})^2 = \sum_{i=1}^{n} (X_i^2 - 2\overline{X}X_i + \overline{X}^2)$$

$$= \sum_{i=1}^{n} X_i^2 - 2\overline{X} \left(\sum_{i=1}^{n} X_i + n \overline{X}^2 \right)$$

$$= \sum_{i=1}^{n} X_i^2 - 2\overline{X} \left(\sum_{i=1}^{n} X_i + n \overline{X}^2 \right)$$

$$\sum_{i=1}^{n} (X_i - \overline{X})^2 = \sum_{i=1}^{n} X_i^2 - n\overline{X}^2$$

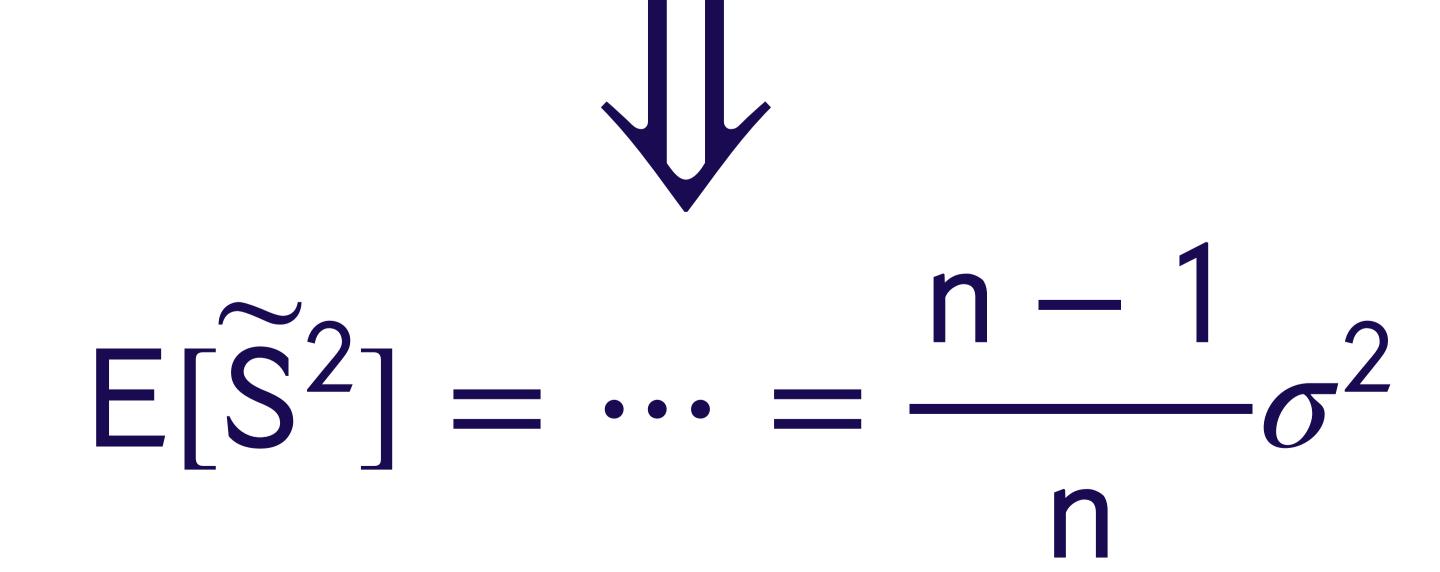

$$= \sum_{i=1}^{n} X_i^2 - n \left(\sum_{i=1}^{n} X_i / n \right)^2$$

$$=\sum_{i=1}^{n}X_{i}^{2}-\frac{\left(\sum_{i=1}^{n}X_{i}\right)^{2}}{n}$$

$$Var[X] = E[(X - \mu)^2] = E[X^2] - (E[X])^2$$

$$E[X^2] = Var[X] + (E[X])^2$$

$$= \sigma^2 + \mu^2$$

"sample variance"

Variant of Sample Variance:

$$S^{2} = \frac{\sum_{i=1}^{n} (X_{i} - \overline{X})^{2}}{n-1}$$

$$S^2 = \frac{n}{n-1} \tilde{S}^2$$

$$\Rightarrow E[S^2] = \frac{n}{n-1} E[\widetilde{S}^2]$$

$$= \frac{n}{n-1} \frac{n-1}{\sigma^2} \sigma^2 = \sigma^2$$

$$= \frac{n}{n-1} \frac{n}{n} \frac{n-1}{n} \sigma^2 = \frac{\sigma^2}{n}$$

$$S^{2} = \frac{\sum_{i=1}^{n} (X_{i} - \overline{X})^{2}}{n-1}$$

is an unbiased estimator of σ^2 .

(i.e.
$$E[S^2] = \sigma^2$$
)

This is the sample variance that we will use.

$$\overline{X} = \frac{1}{n} \sum_{i=1}^{n} X_i$$
 $S^2 = \frac{\sum_{i=1}^{n} (X_i - \overline{X})^2}{n-1}$

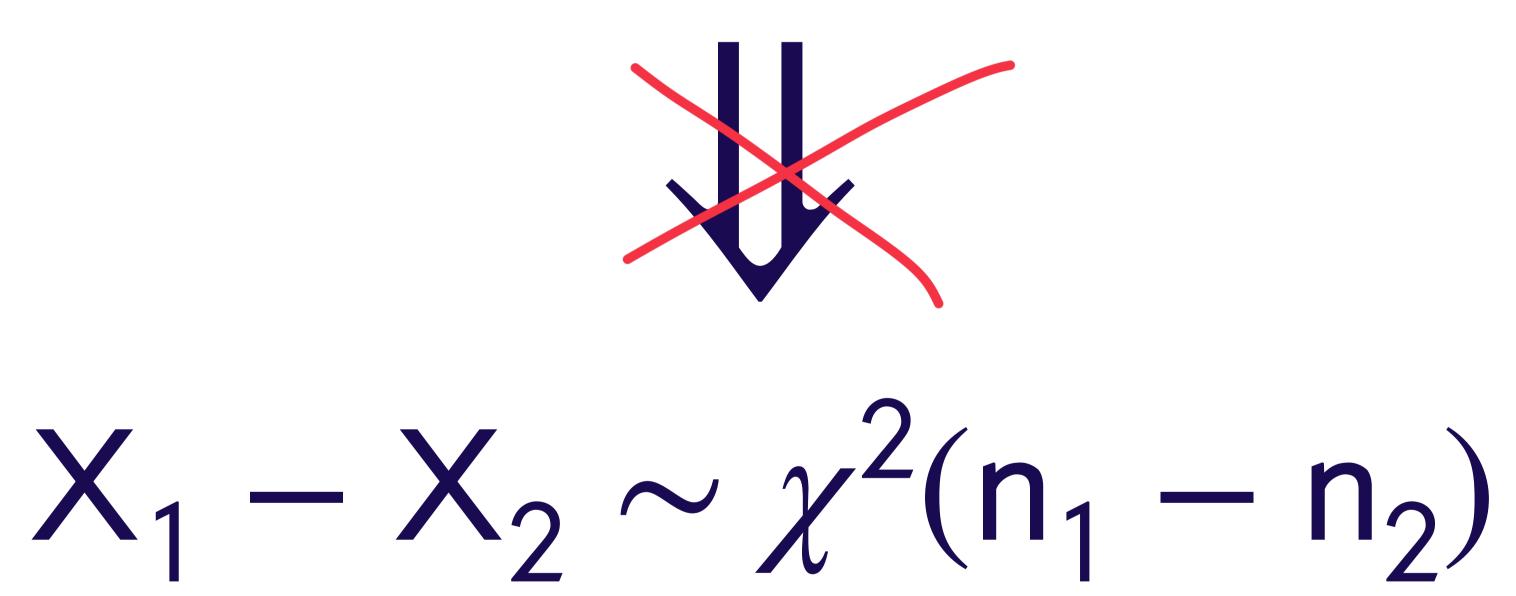

For the normal distribution, these are independent!

Aside:

$$X_1 \sim \chi^2(n_1)$$
 and $X_2 \sim \chi^2(n_2)$ independent

Aside:

$$X_1 \sim \chi^2(n_1)$$
 and $X_2 \sim \chi^2(n_2)$ independent

However,

$$X_1 \sim \chi^2(n_1)$$
 and $X_2 \sim \chi^2(n_2)$
 $X_3 \sim ?$

$$X_1 = X_2 + X_3$$

and X₂ and X₃ independent

$$\frac{1}{2} \left(\frac{1}{2} \right)^{2} \left(\frac{1}{2} \right)^{2} = \frac{1}{2} \left($$

$$X_3 = X_1 - X_2 \sim \chi^2(n_1 - n_2)$$

$$\sum_{i=1}^{n} (X_{i} - \mu)^{2}$$

$$= \sum_{i=1}^{n} (X_{i} - \overline{X} + \overline{X} - \mu)^{2}$$

$$= \sum_{i=1}^{n} (X_{i} - \overline{X})^{2}$$

$$+2(\overline{X} - \mu) \sum_{i=1}^{n} (X_{i} - \overline{X})$$

$$+ n (\overline{X} - \mu)^{2}$$

$$\sum_{i=1}^{n} (X_i - \mu)^2$$

$$= \sum_{i=1}^{n} (X_i - \overline{X} + \overline{X} - \mu)^2$$

$$= \sum_{i=1}^{n} (X_i - \overline{X})^2 + n (\overline{X} - \mu)^2$$

Let $X_1, X_2, ..., X_n$ be a random sample from the normal distribution with mean μ and variance σ^2 .

$$\sum_{i=1}^{n} (X_{i} - \mu)^{2} = \sum_{i=1}^{n} (X_{i} - \overline{X})^{2} + n (\overline{X} - \mu)^{2}$$

$$\frac{\sum_{i=1}^{n} (X_i - \mu)^2}{\sigma^2}$$

$$= \frac{\sum_{i=1}^{n} (X_i - \overline{X})^2}{\sigma^2} + \frac{n(\overline{X} - \mu)^2}{\sigma^2}$$

$$\frac{\sum_{i=1}^{n} (X_{i} - \mu)^{2}}{\sigma^{2}} = \sum_{i=1}^{n} \left(\frac{X_{i} - \mu}{\sigma}\right)^{2}$$

$$\chi^{2}(n)$$

$$\chi^{2}(1)$$

$$\frac{\sum_{i=1}^{n} (X_i - \mu)^2}{\sigma^2}$$

$$= \frac{\sum_{i=1}^{n} (X_i - \overline{X})^2}{\sigma^2} + \frac{n(\overline{X} - \mu)^2}{\sigma^2}$$

$$\frac{\operatorname{n}(\overline{X} - \mu)^{2}}{\sigma^{2}} = \left(\frac{\overline{X} - \mu}{\sigma/\sqrt{n}}\right)^{2}$$

$$N(0, 1)$$

$$\chi^{2}(1)$$

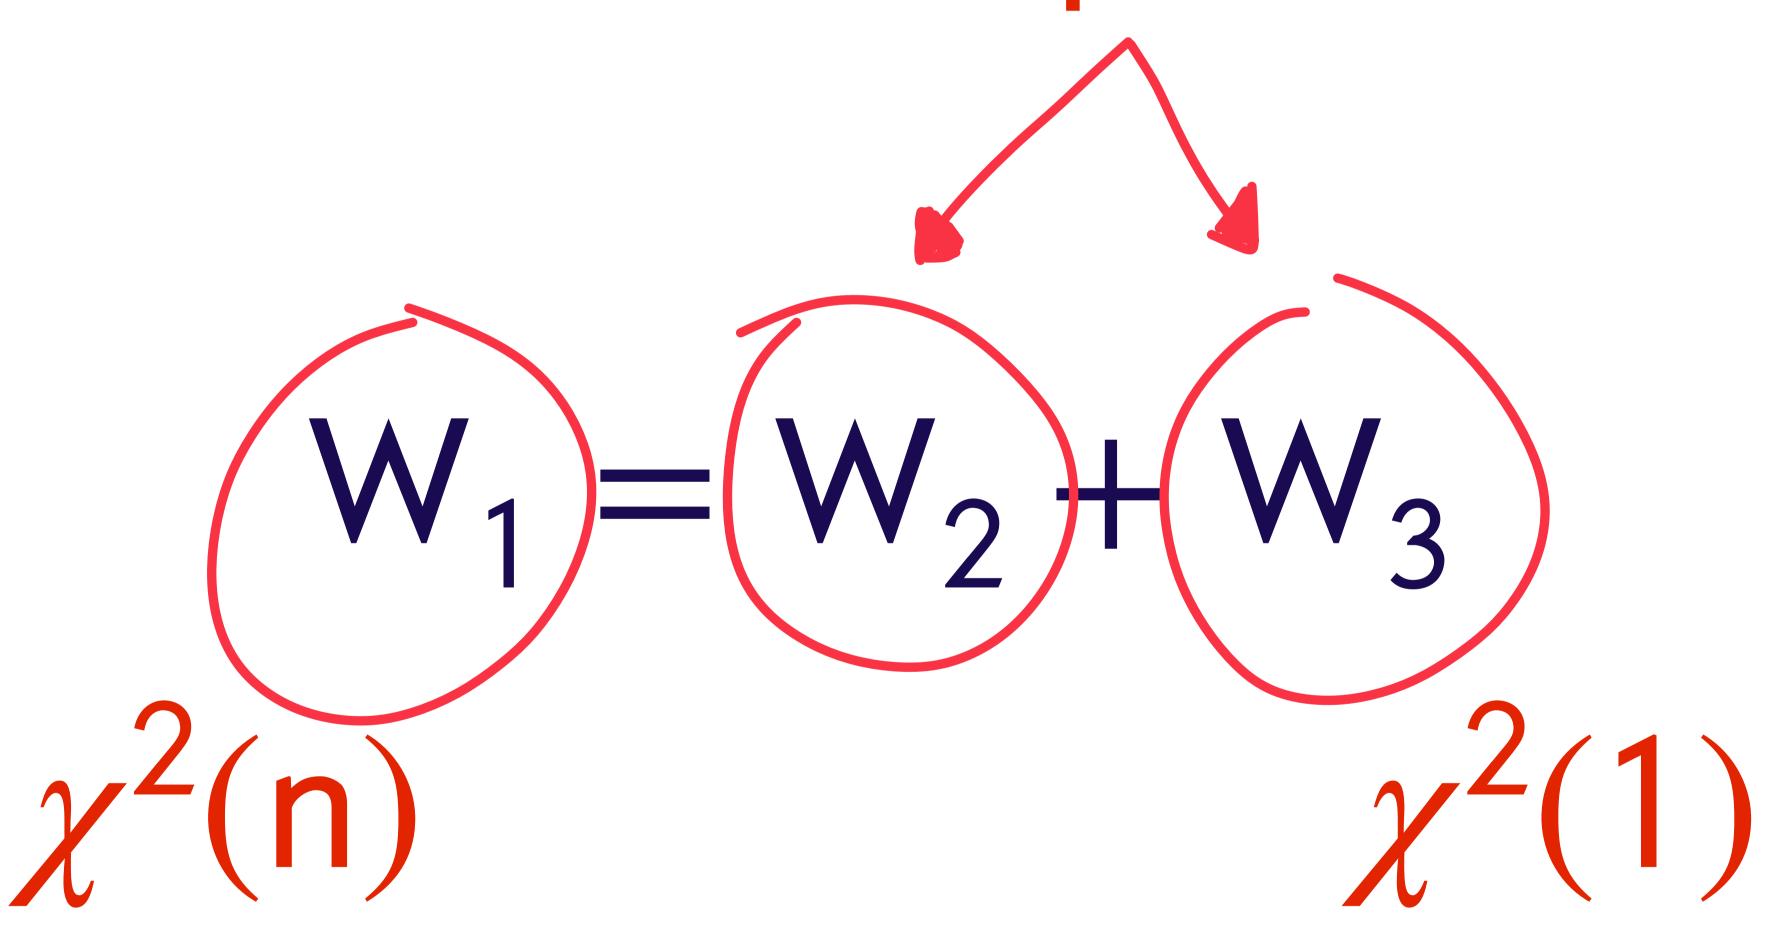

Let $X_1, X_2, ..., X_n$ be a random sample from the normal distribution with mean μ and variance σ^2 . $(n-1)S^2$

$$\sum^{n} (X - \mu)^{2} \sum^{n} (X - \overline{X})^{2}$$

$$+\frac{n(\overline{X}-\mu)^2}{\sigma^2}$$

Let $X_1, X_2, ..., X_n$ be a random sample from the normal distribution with mean μ and variance σ^2 .

independent

Let $X_1, X_2, ..., X_n$ be a random sample from the normal distribution with mean μ and variance σ^2 .

$$\Rightarrow W_2 = \frac{(n-1)S^2}{\sigma^2} \sim \chi^2(n-1)$$
